

# The search for primordial gravitational waves: latest results from BICEP

Clem Pryke for the BICEP/SPO Collaboration  
mm Universe – Chicago June 30 2025

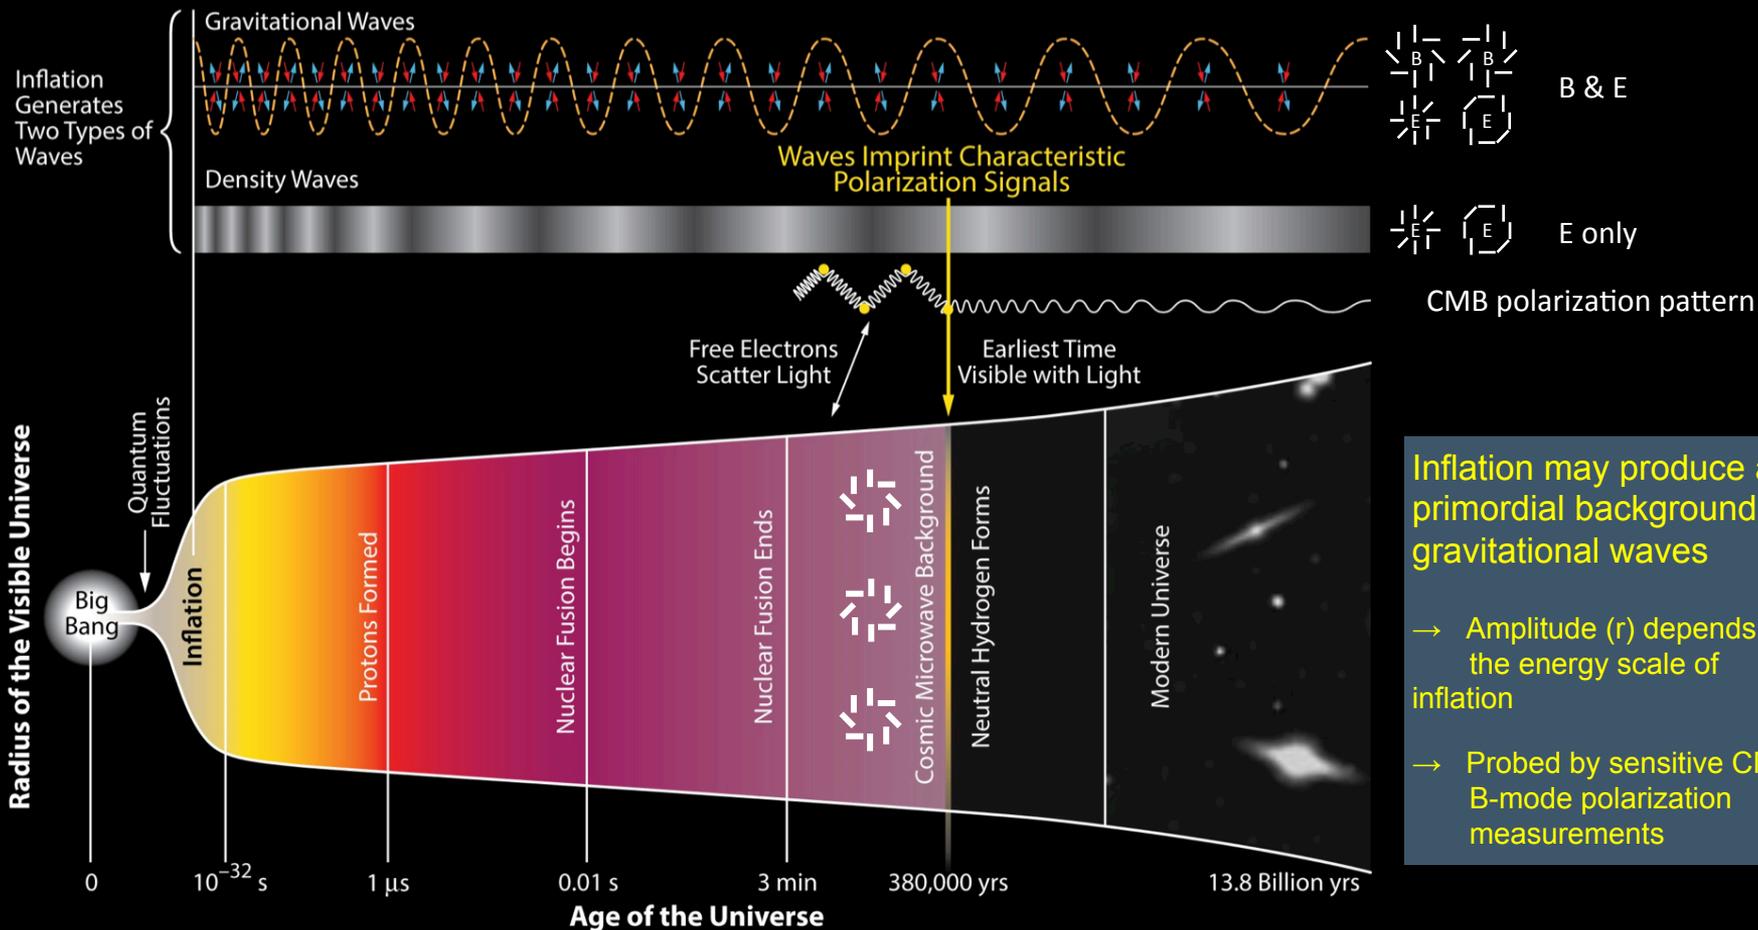

# The BICEP Collaboration

# SEARCHING FOR INFLATIONARY B-MODES

**Inflation may produce a primordial background of gravitational waves**

- Amplitude ( $r$ ) depends on the energy scale of inflation
- Probed by sensitive CMB B-mode polarization measurements

# SOUTH POLE: THE CLOSEST THING TO SPACE ON THE EARTH

An aerial photograph of the South Pole research station. The station is a cluster of white and grey buildings and structures, surrounded by a flat, snow-covered landscape. A long, narrow, dark path or road leads from the foreground towards the station. The horizon is a straight line, and the sky is a clear, bright blue with a few wispy clouds. The sun is visible in the upper right quadrant, creating a bright glow and some lens flare.

High and dry site

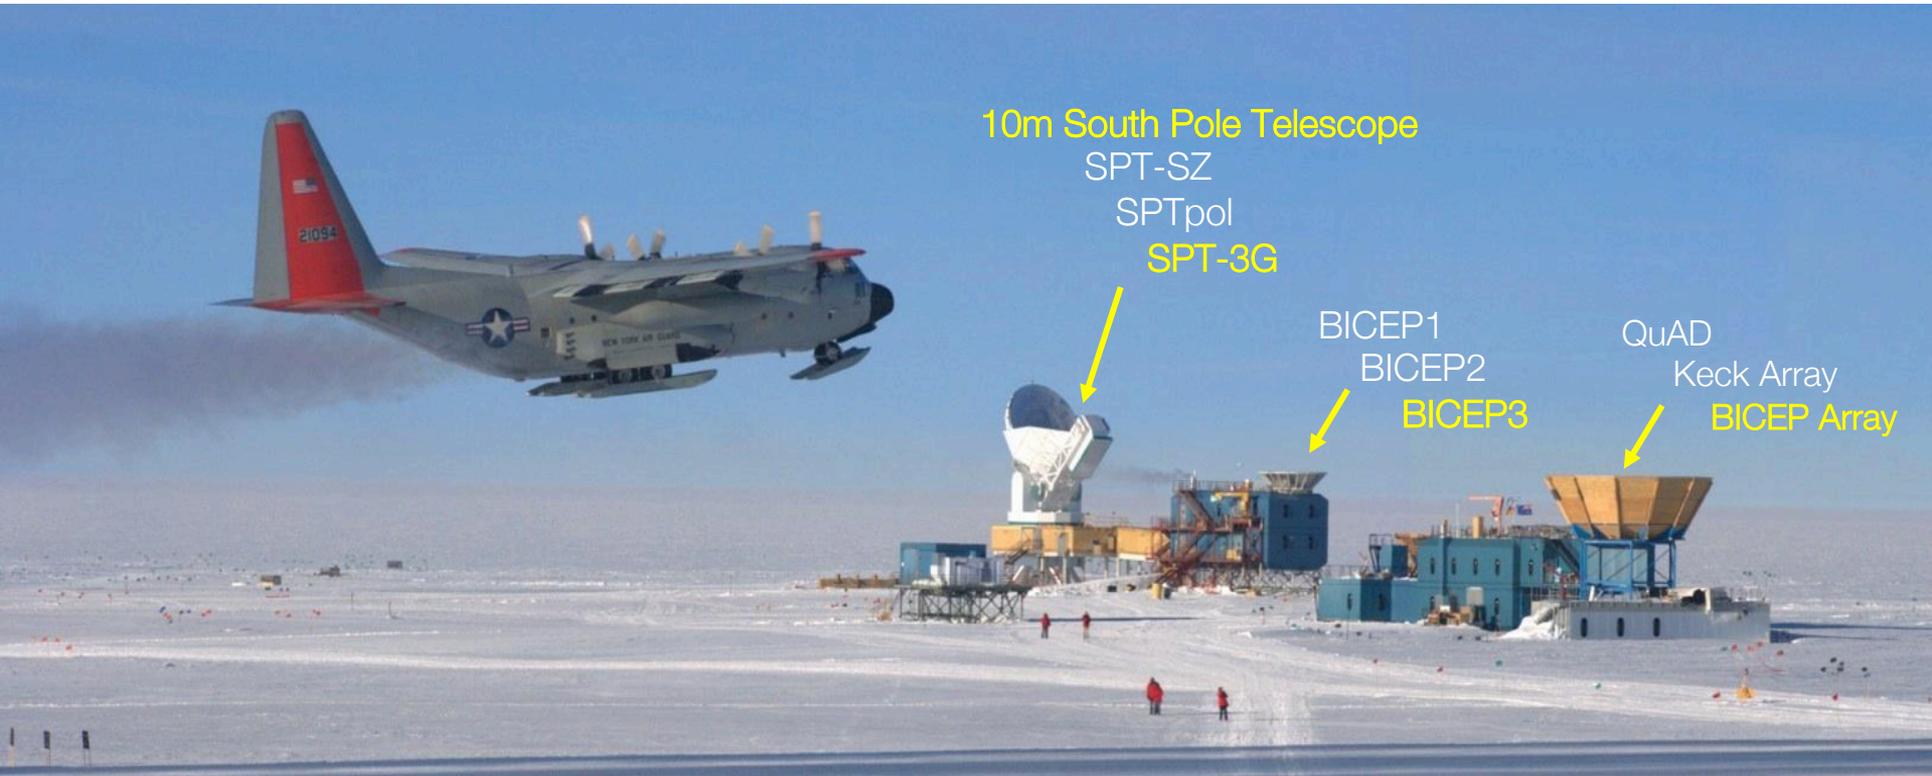

1 diurnal cycle per year: low-noise and stable atmosphere

Featureless horizon

24/7 observing access to cleaner sky regions

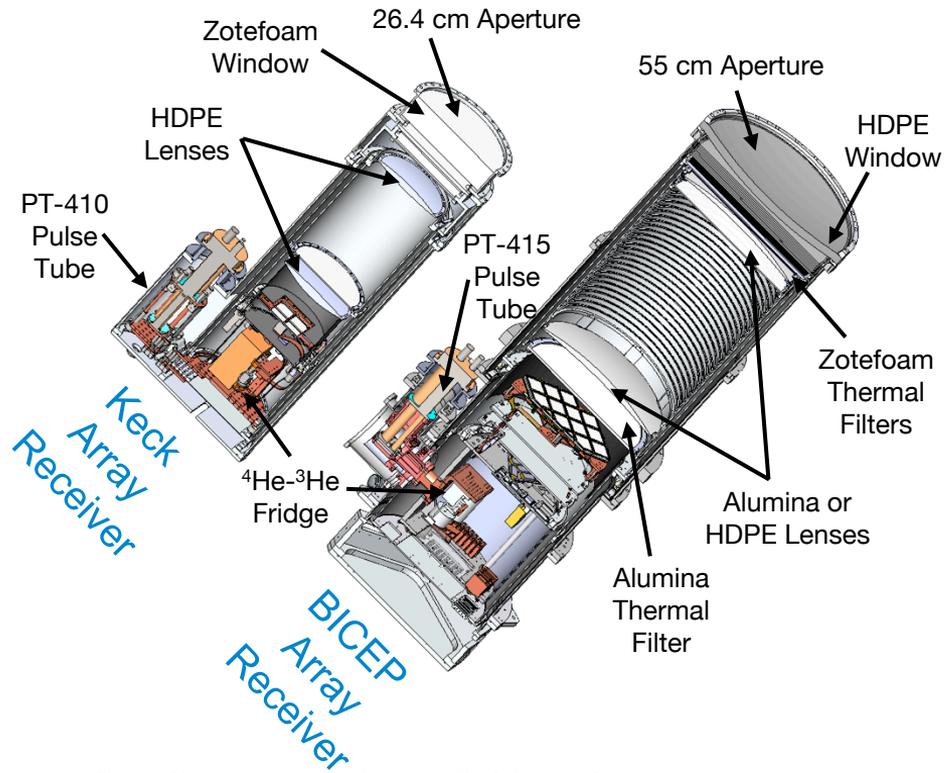

Excellent logistics for power, data, & cargo

# THE SOUTH POLE OBSERVATORY

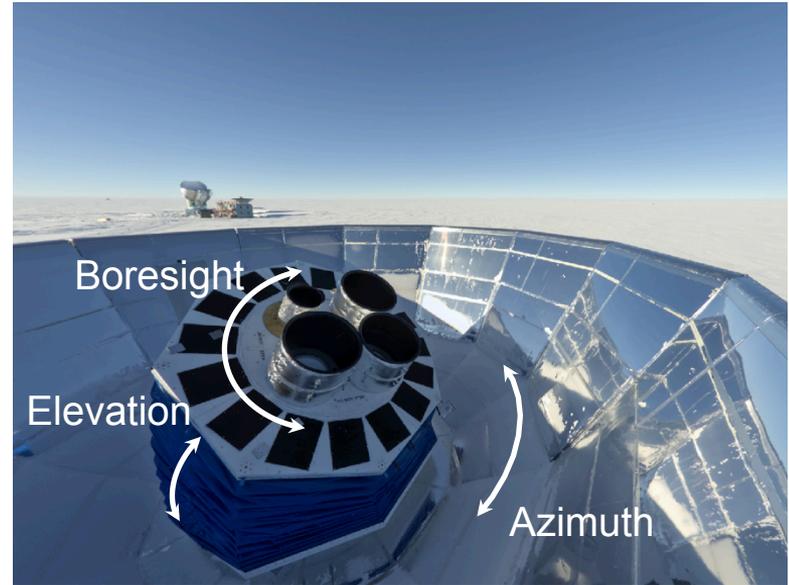

Observatories mostly reuse existing facilities and remain state of the art by upgrading receivers!

# BICEP SMALL APERTURE CONCEPT

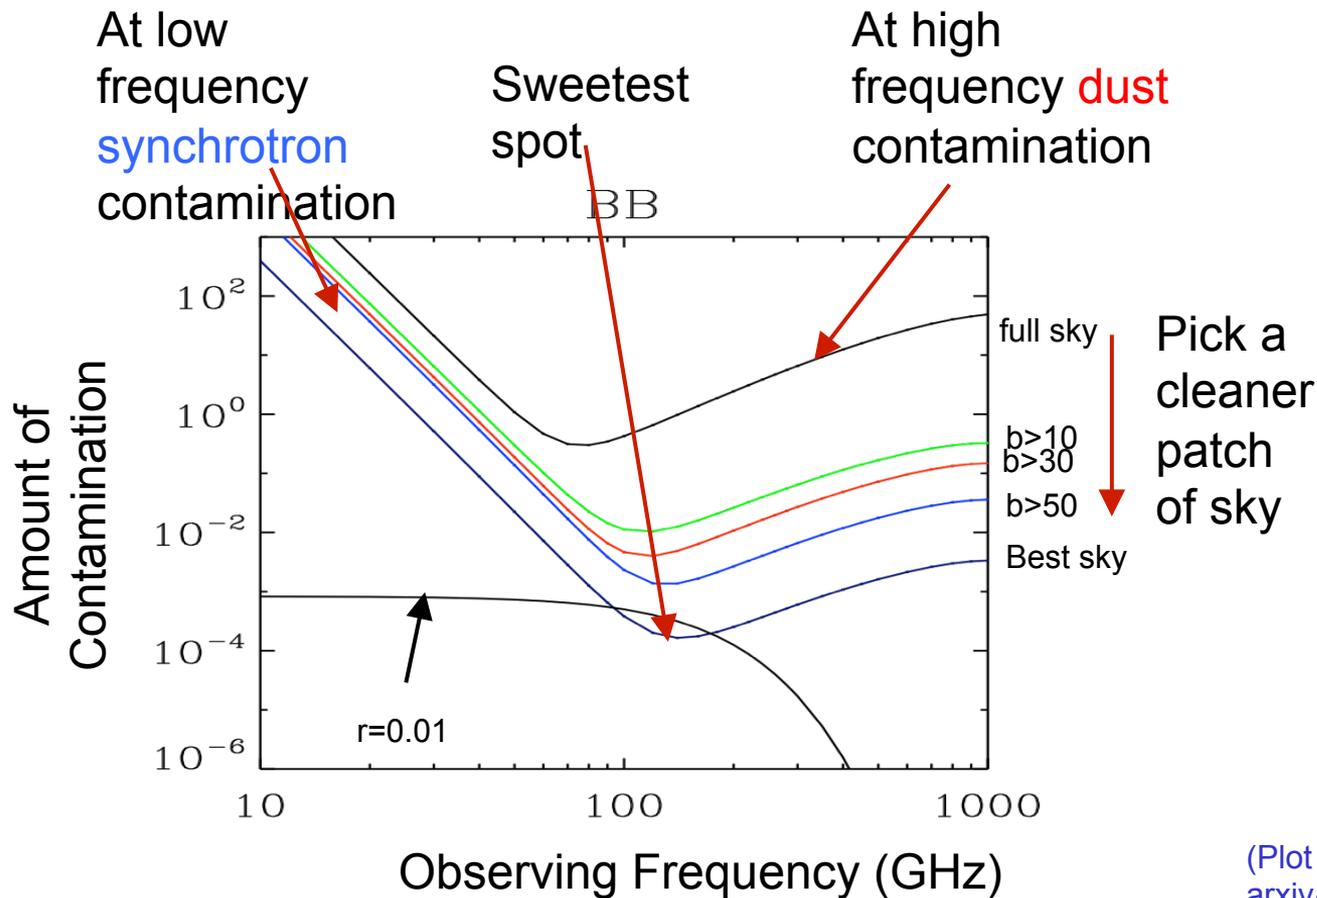

- Small aperture, large field of view
- Refracting 4K optics with low sidelobes
- 55-cm design increases mapping speed by  $\sim 15x$

## BICEP Array Telescope Mount

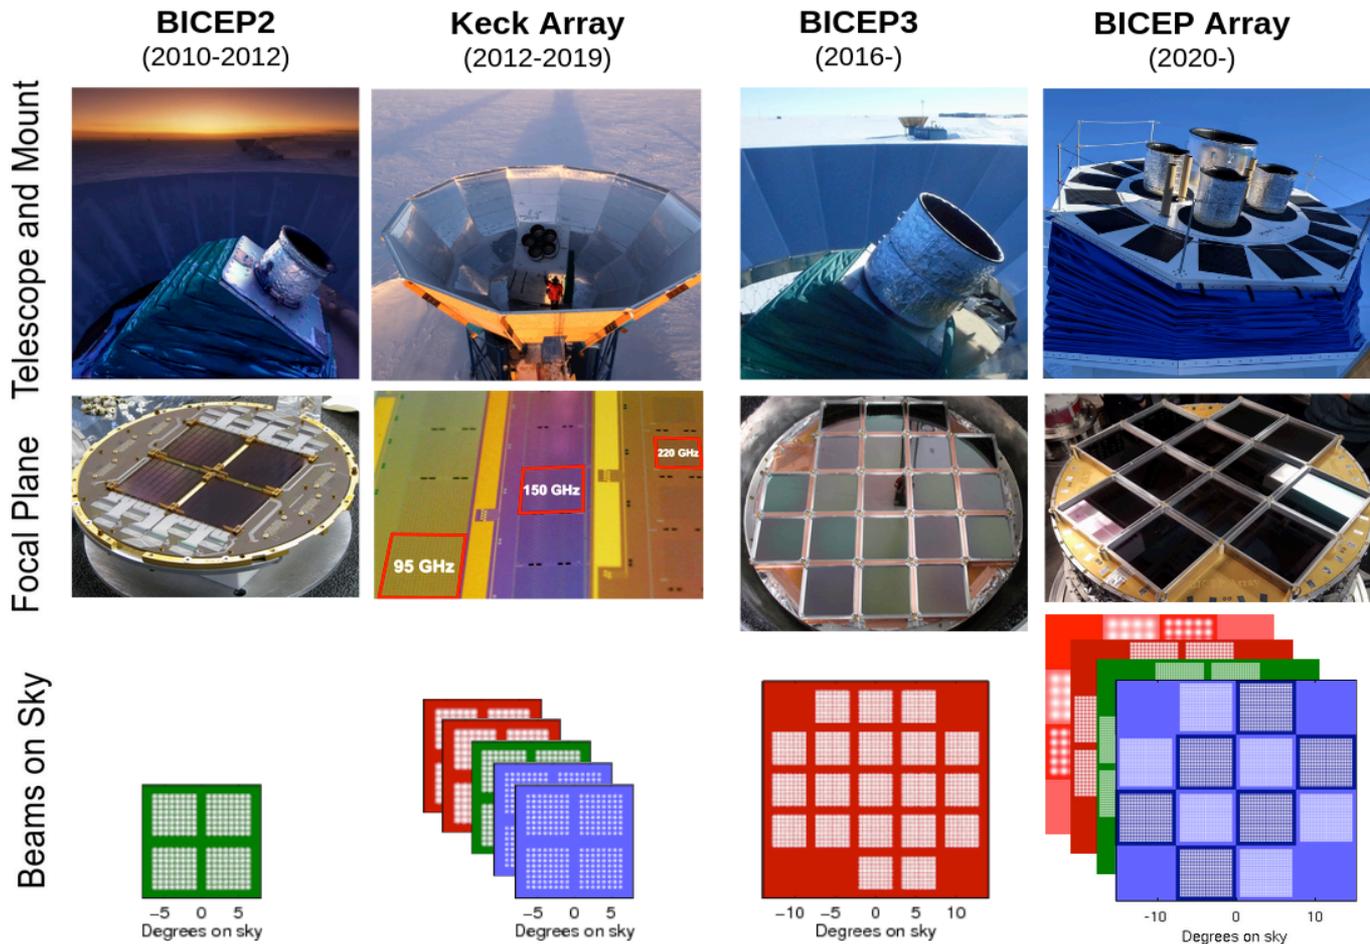

- Small aperture enables boresight rotation
- Co-rotating absorbing forebaffle
- Reflecting ground shield

# Polarized Foreground Contamination from Our Galaxy

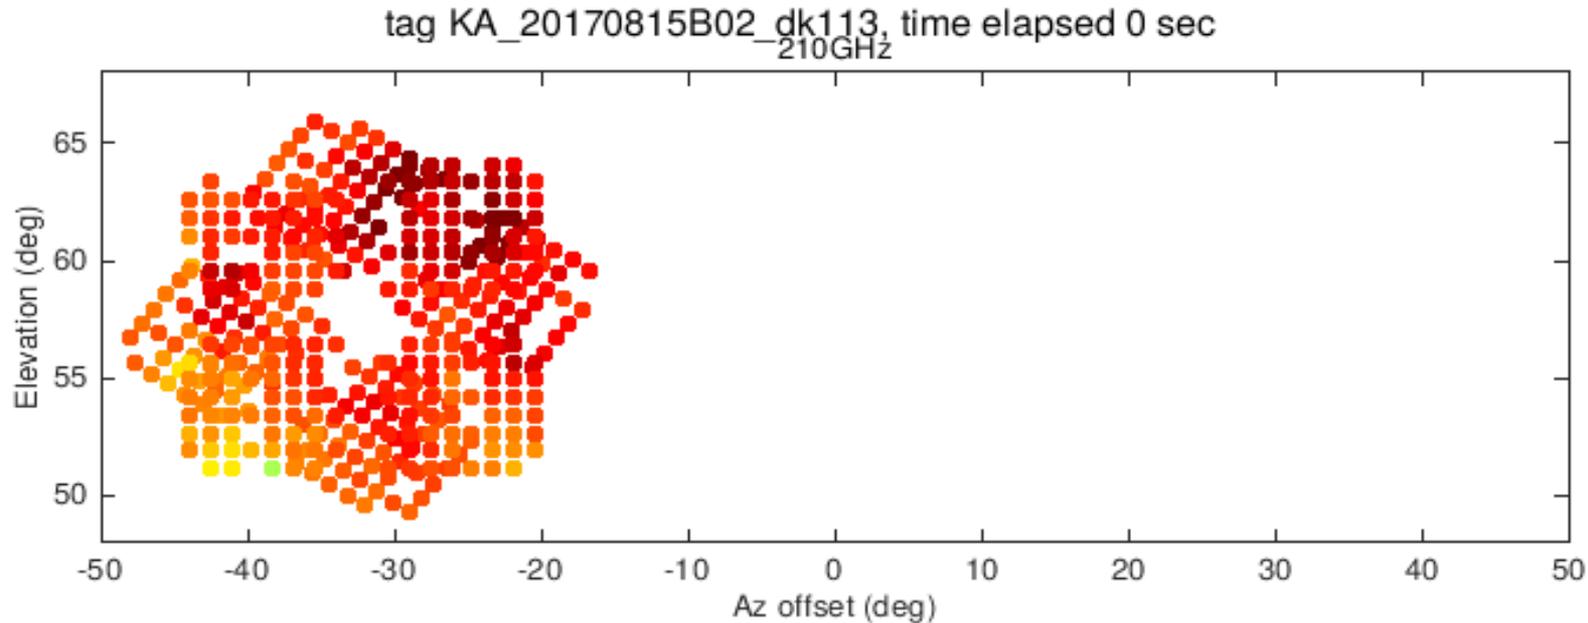

Since the different components of the sky pattern have different frequency dependencies one can separate them by making maps at multiple frequencies – and probe deeper for an inflation signal

# BICEP EXPERIMENTAL PHASES SINCE 2010

# Bolometer readouts as the telescope scans back and forth

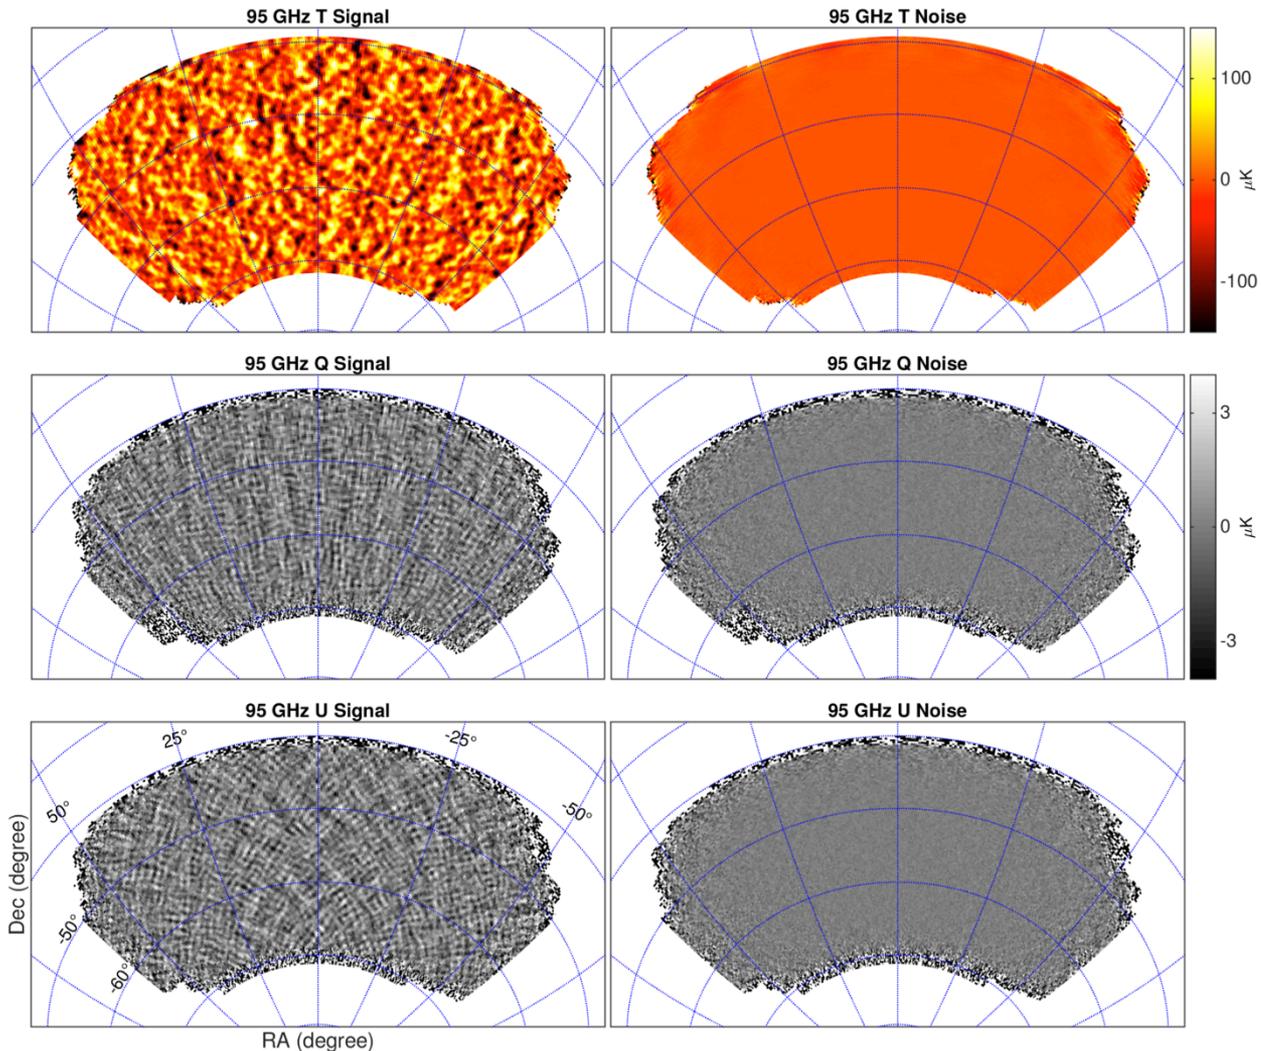

The physical temperature of the detectors tracks the intensity of the incoming radiation from little “spots” on the sky.

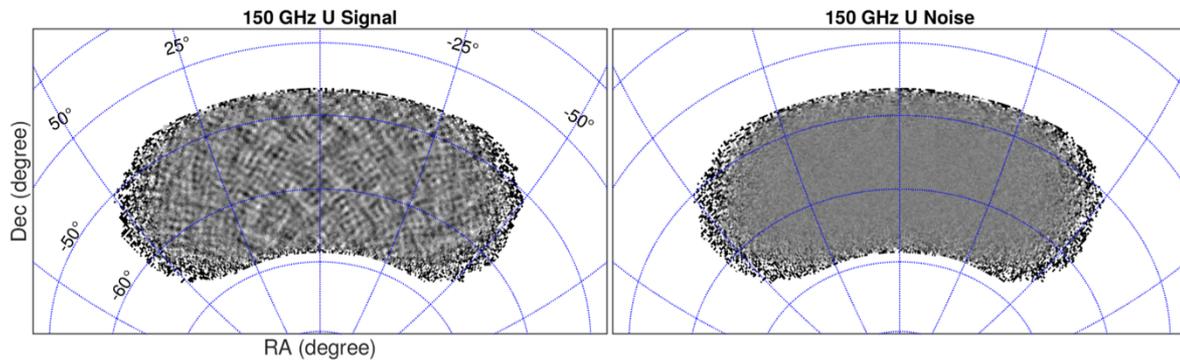

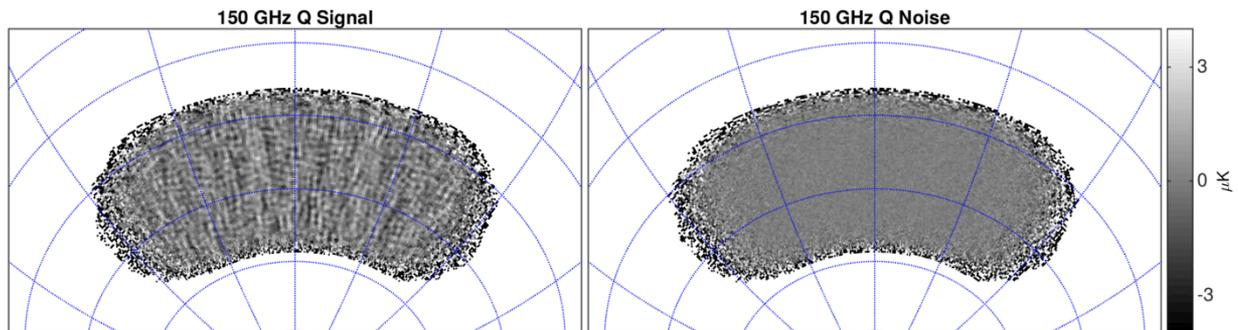

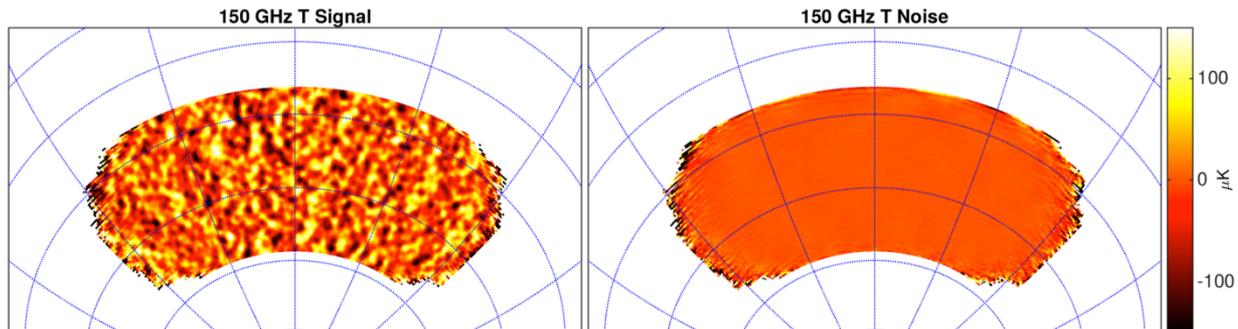

This plot is unpolarized – we are seeing “clouds” blowing across the scan region.

# BK18 95GHz Maps

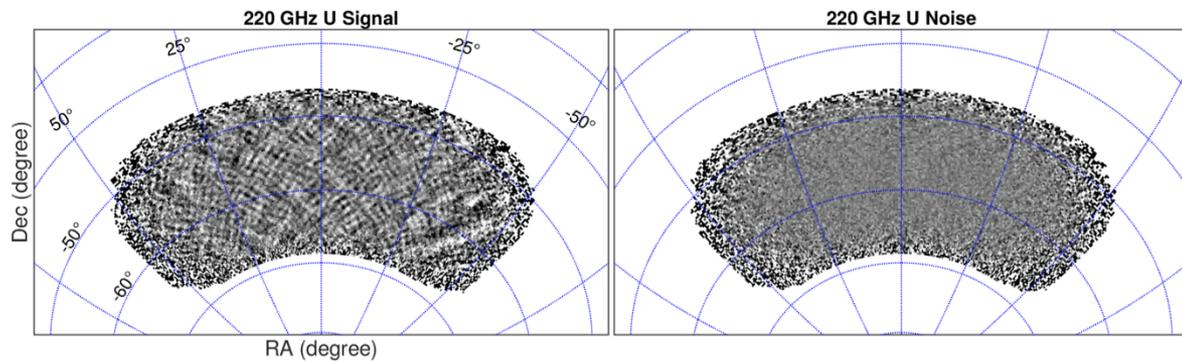

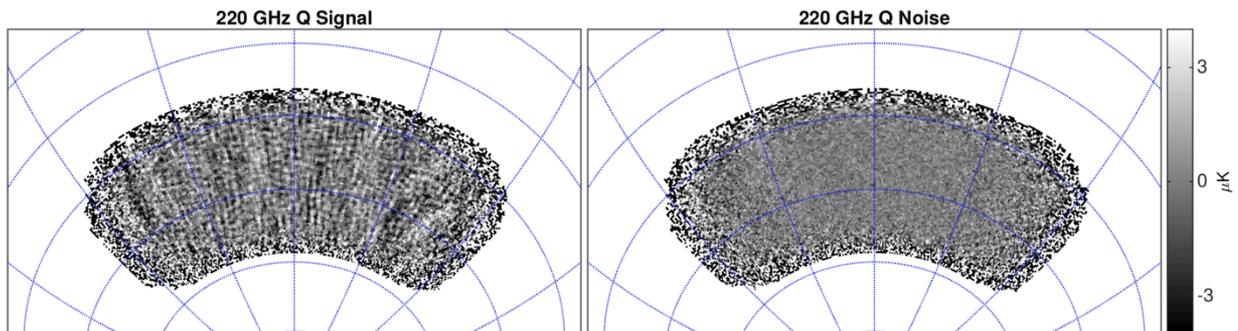

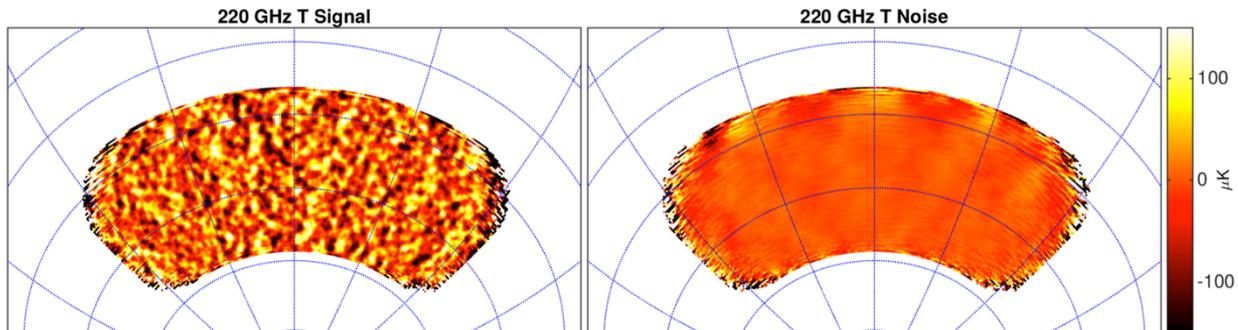

BK18 uses all BICEP/Keck data taken up to 2018. This result actually came out in fall 2021 – it takes time to go from raw data to final result!

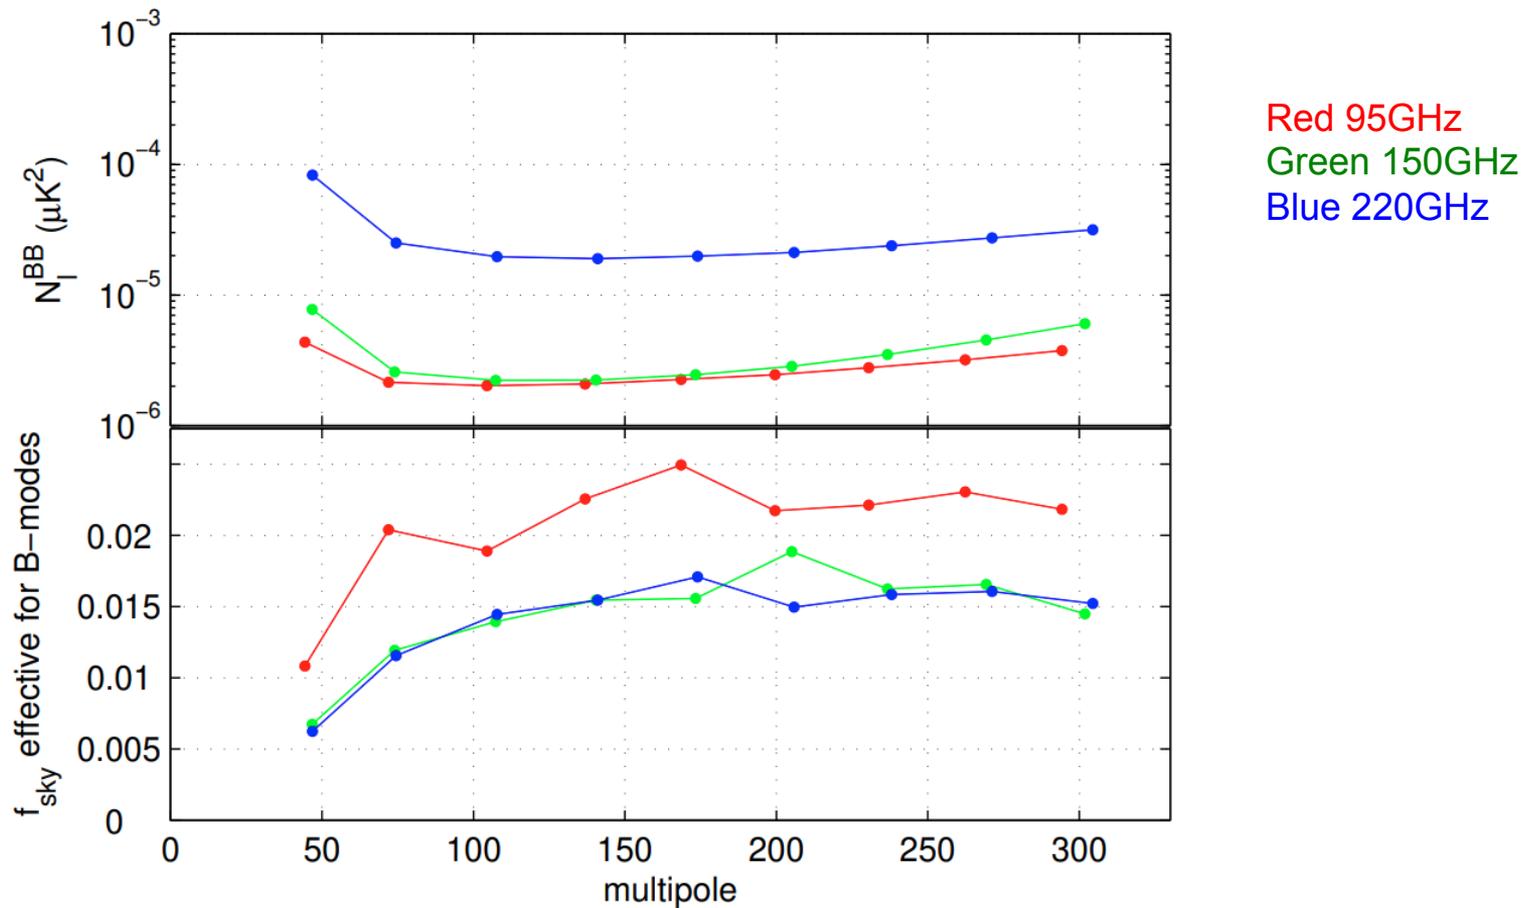

# BK18 150GHz Maps

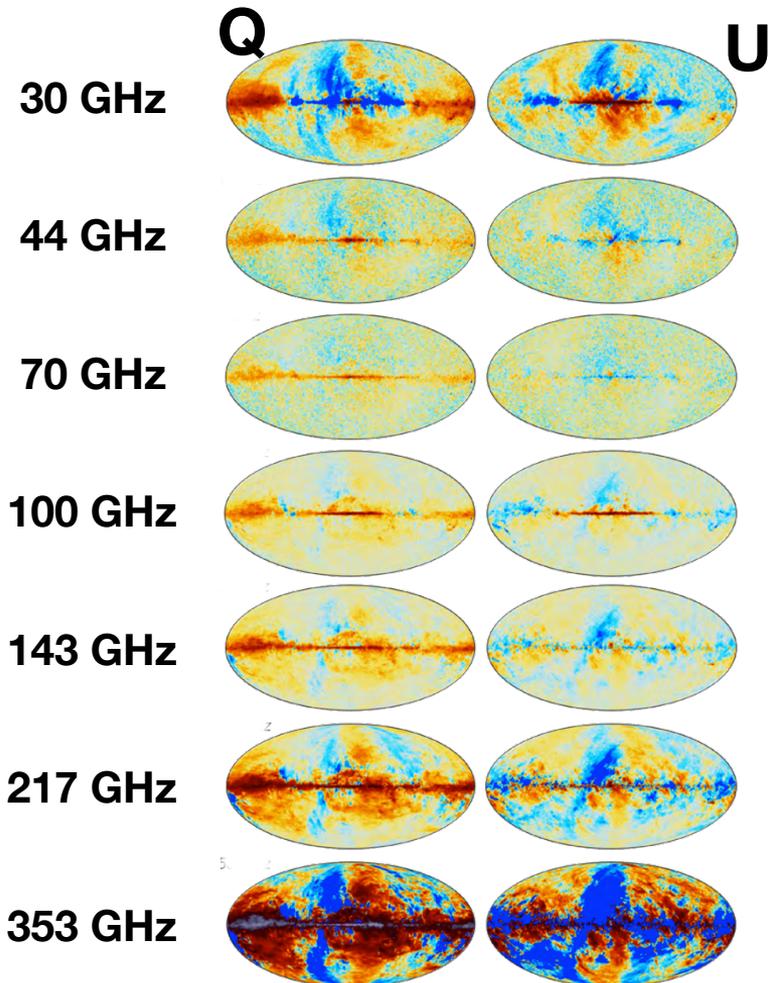

# BK18 220GHz Maps

# BK18 Noise Spectra and $f_{\text{sky}}$ Effective

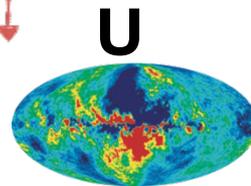

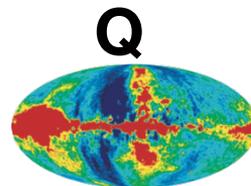

Add to the mix: Planck at 7 frequencies and WMAP at 2 frequencies

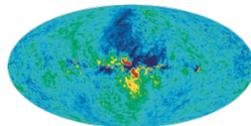

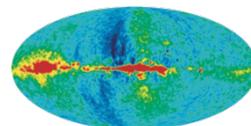

Polarized galactic  
**synchrotron** dominates  
at low frequencies

23 GHz

33 GHz

From arxiv 1212.5225

Polarized thermal  
emission ( $\sim 20\text{K}$ ) from  
galactic **dust** aligned in  
magnetic fields dominates  
at high frequencies

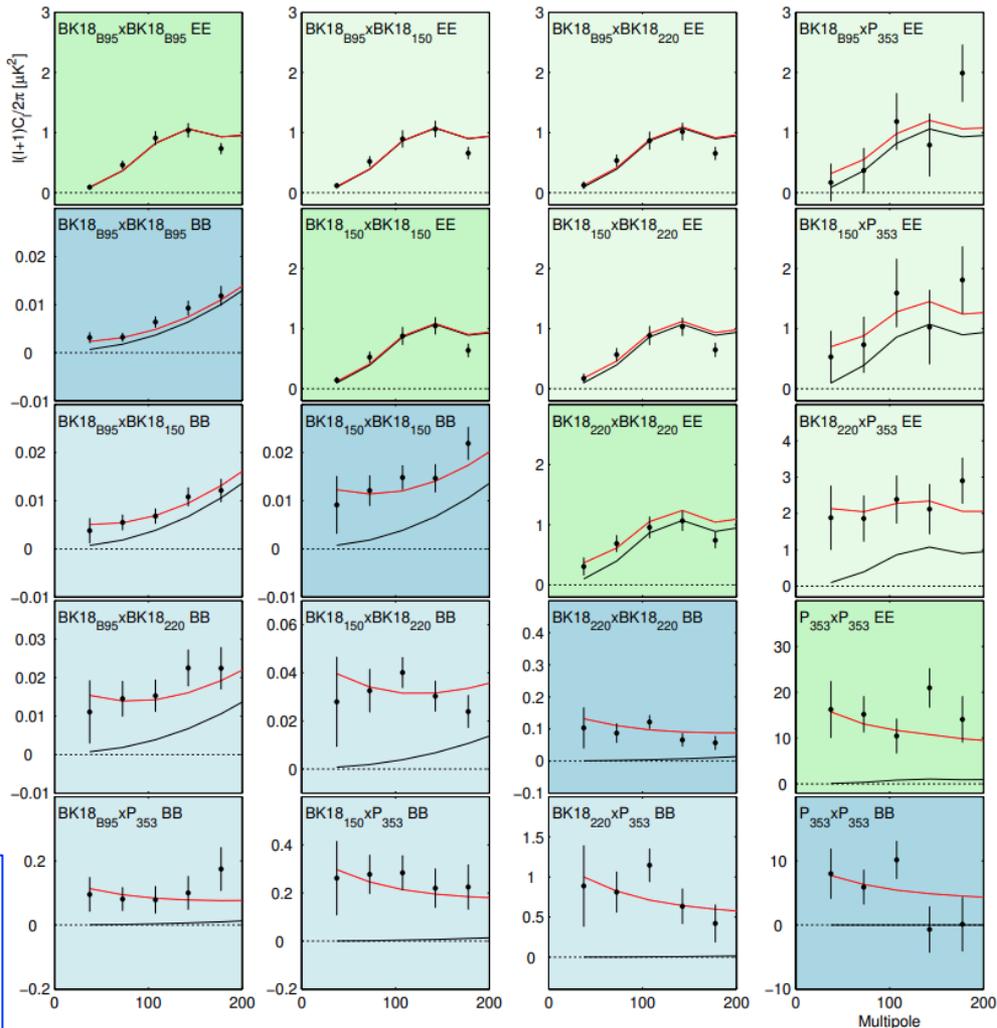

From arxiv 1502.01582

BK18 auto/cross spectra between:  
 BICEP3 95GHz,  
 BICEP2/Keck  
 150GHz,  
 Keck 220GHz,  
 and Planck  
 353GHz

**BK15**  
 arxiv/1810.05216

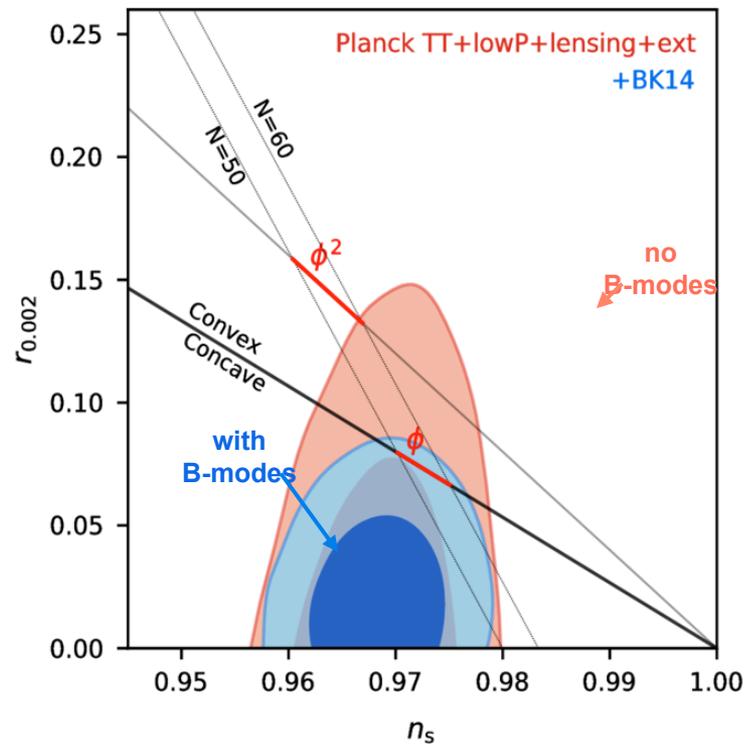

**BK18**  
 arxiv/2110.00483

$r_{.05} < 0.09$

**BKP**

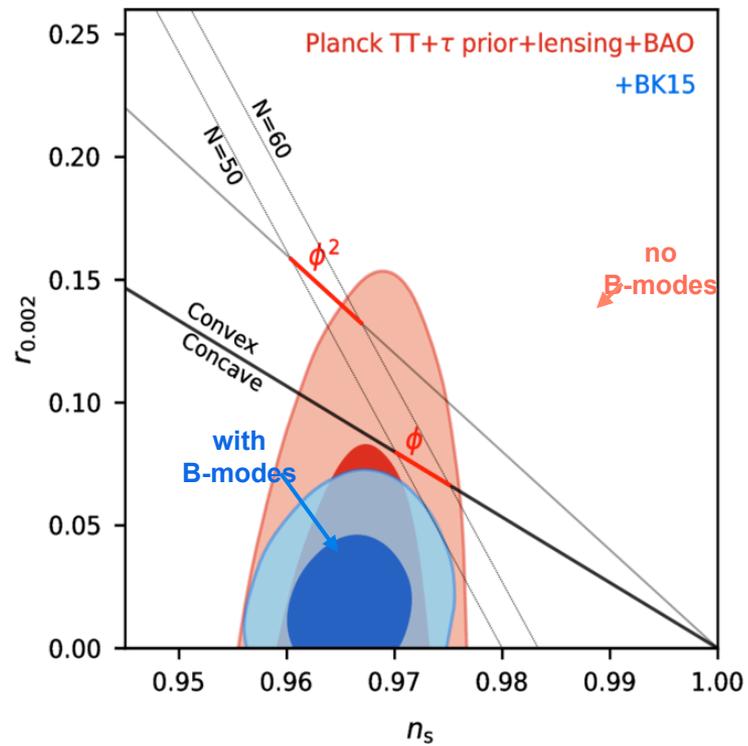

arxiv/1502.00612

$$r_{.05} < 0.07$$

# BK14

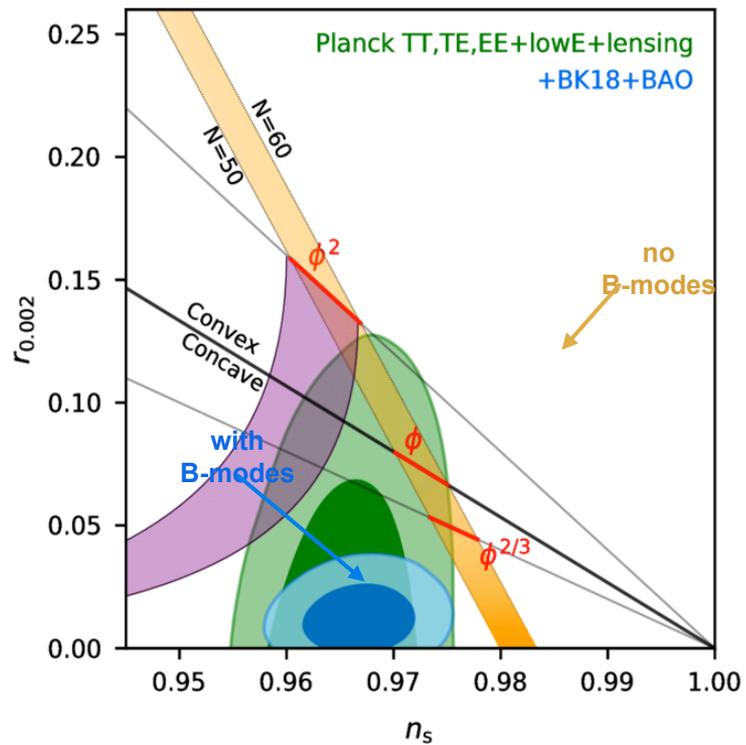

arxiv/1510.09217

$r_{.05} < 0.06$

**BK15**

arxiv/1810.05216

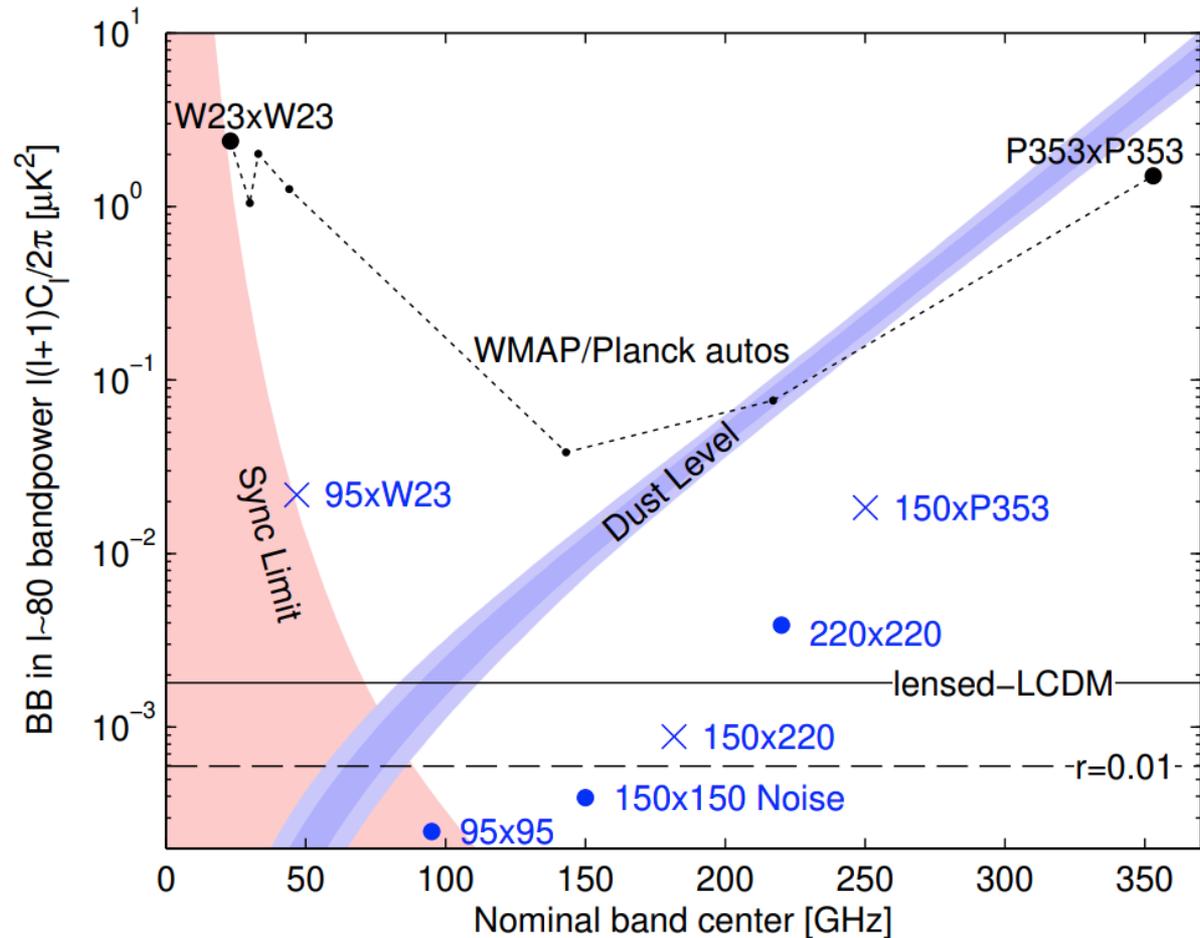

$$r_{.05} < 0.035$$

# BK18

arxiv/2110.00483

# BK18 ell=80 bandpower noise/signal

# What limits BK18?

- ❖ BK18 mainline simulations with dust and lensing give  $\sigma(r)=0.009$
- ❖ Running without foreground parameters on simulations where the dust amplitude is set to zero gives  $\sigma(r)=0.007$

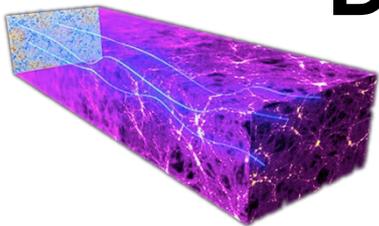

The above is as it should be - we have correctly tuned the relative sensitivity of the 95/150/220 bands such that we don't suffer much penalty due to the presence of foregrounds.

- ❖ Running on simulations which contain no lensing gives  $\sigma(r)=0.004$

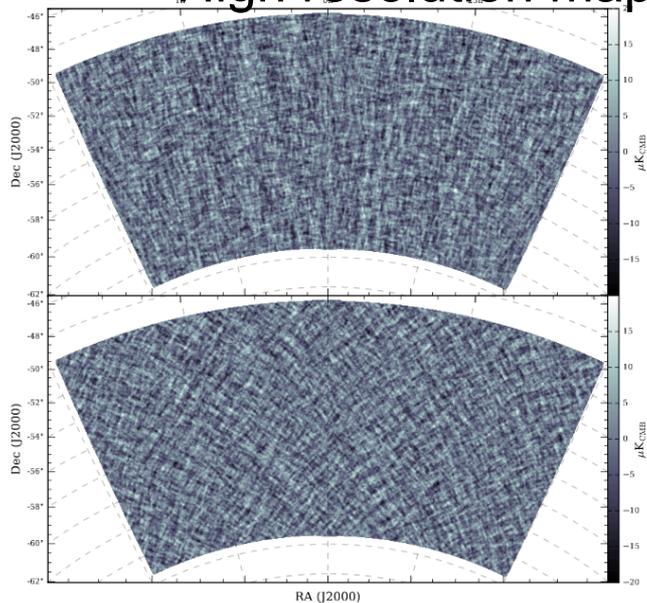

The sample variance of the achromatic lensing foreground is a major limiting factor - we need delensing via high resolution measurements.

- ❖ Running without foreground parameters on simulations which have neither dust or lensing gives  $\sigma(r)=0.002$

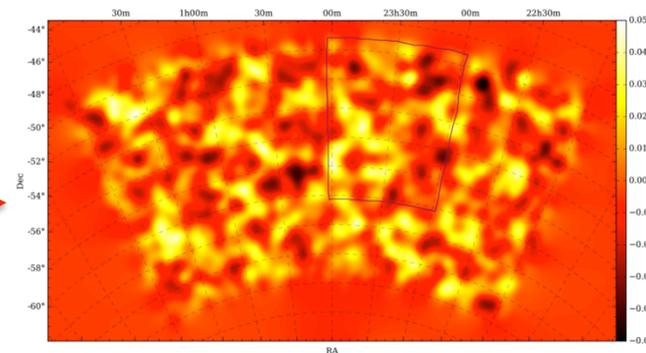

# Delensing with SPT-3G data

High resolution maps

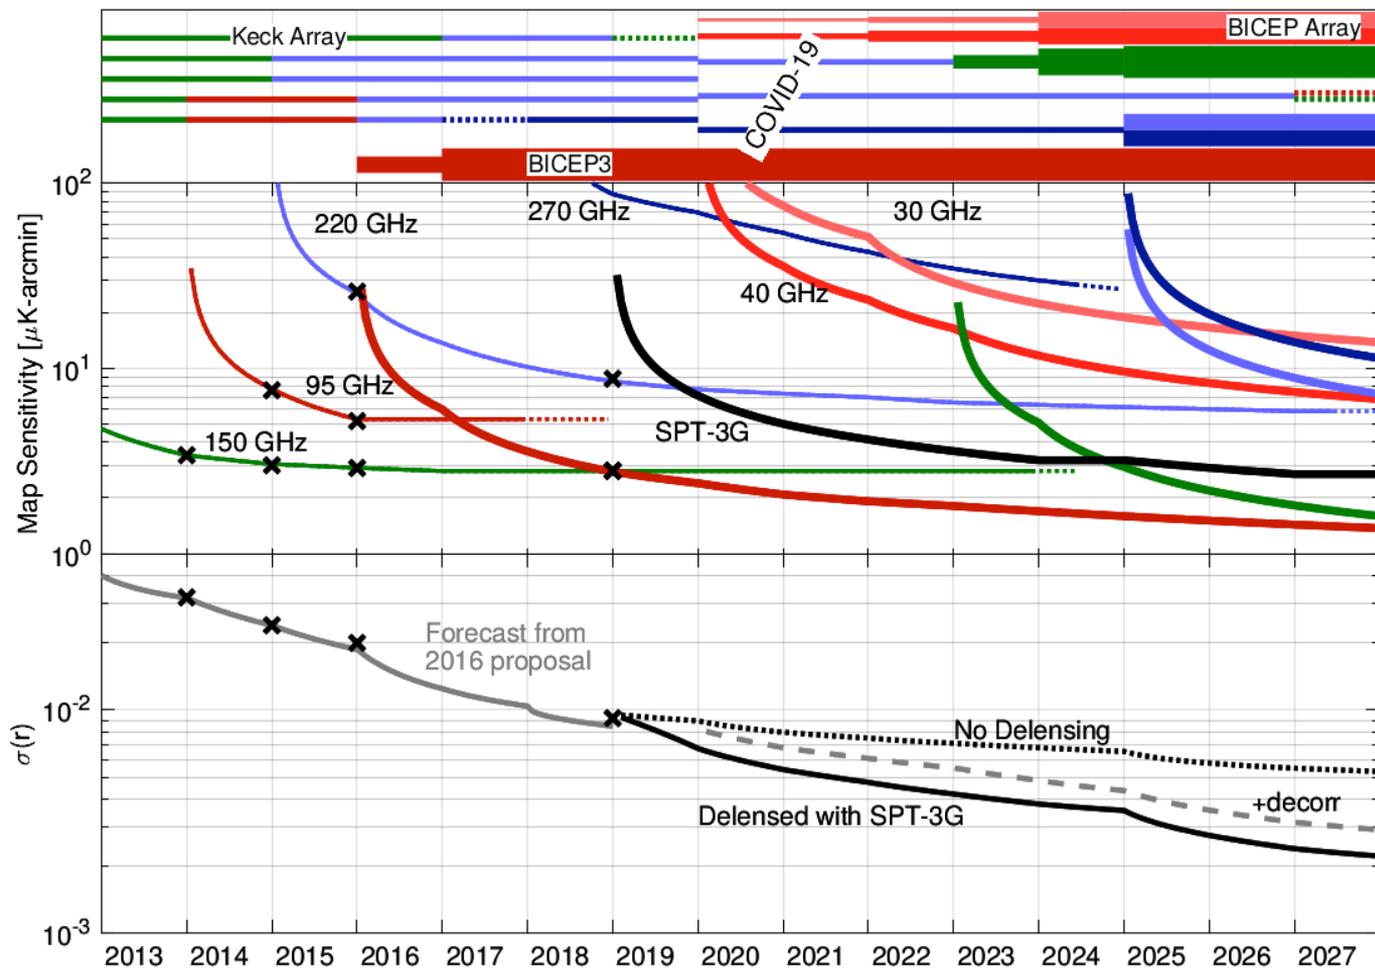

Can be used to reconstruct the lensing deflection map...

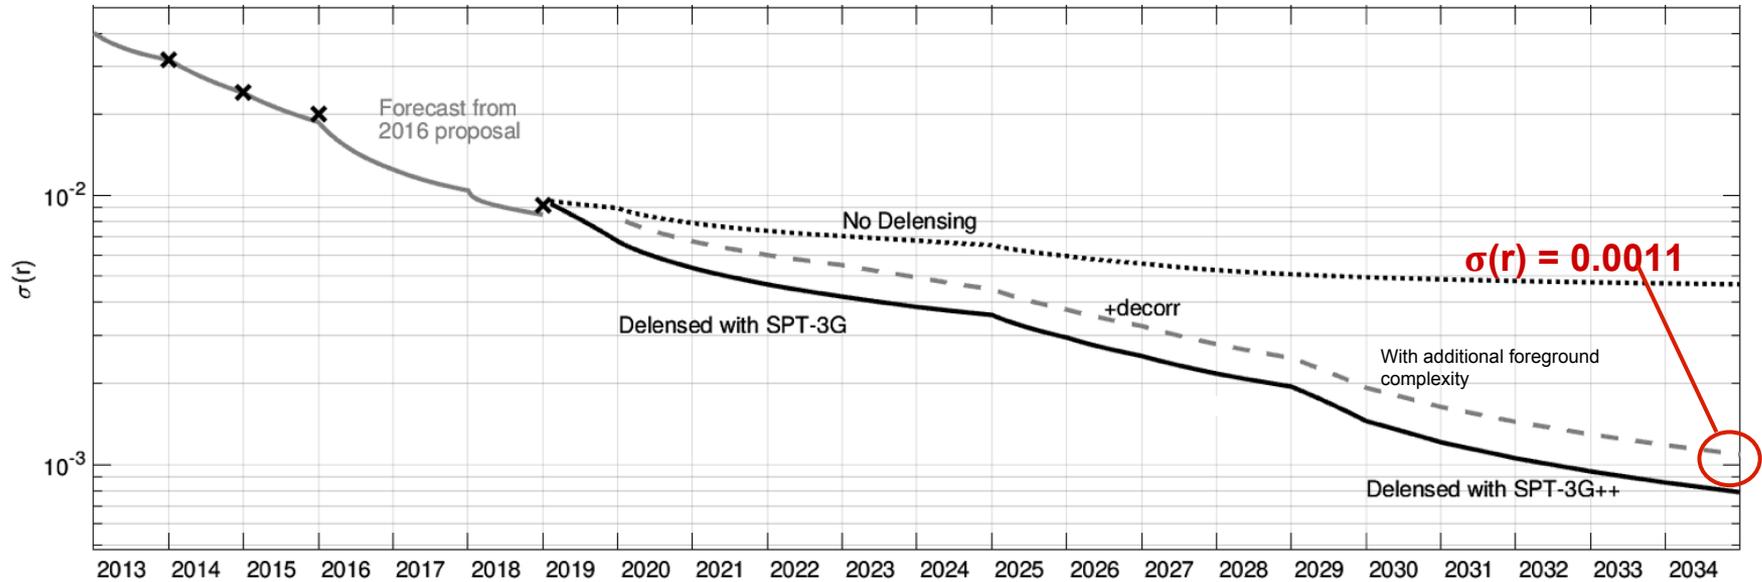

...which can then be used to calculate and remove the lensing signal enabling a deeper search for inflationary gravitational waves

BICEP+SPT=SPO  
(South Pole  
Observatory)

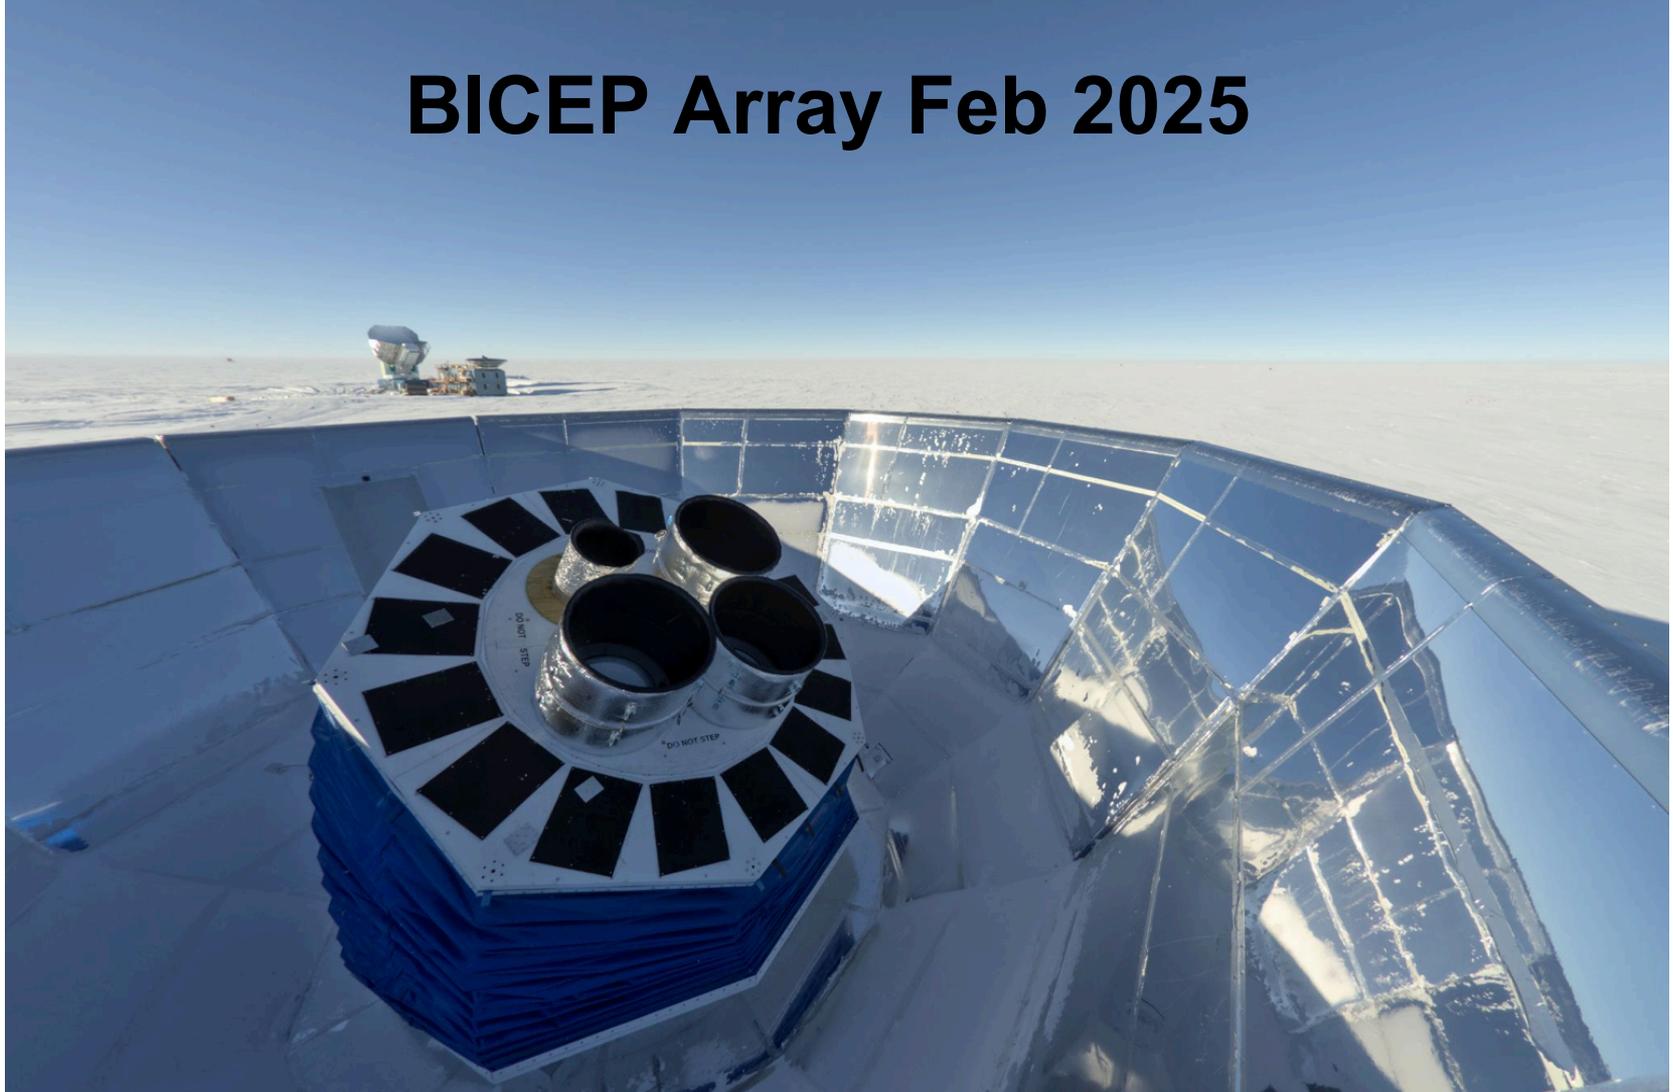

Past sensitivity and  
near future  
projection using  
instrumentation  
which exists or  
soon will

Projection out to 2034 assuming SPT-3G+ starts to observe in 2029 season and BICEP Array receives some upgrades.

# BK24 noise level in the $\ell=80$ bandpower

# Published sensitivity to $r$ from B-modes over time

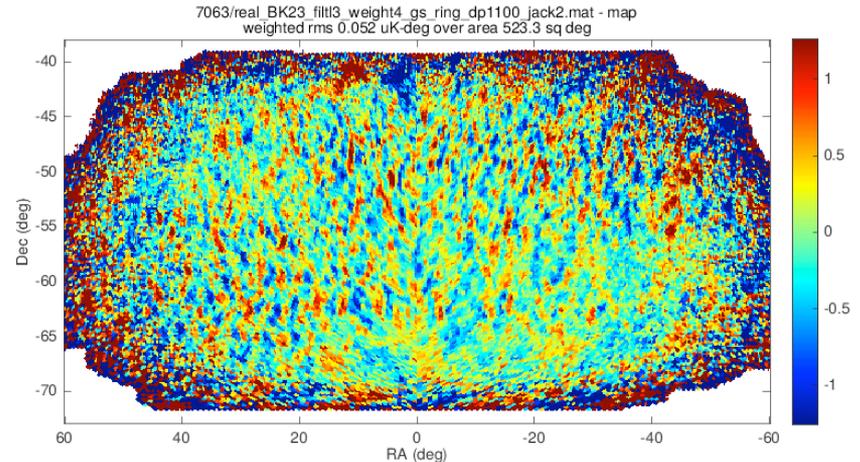

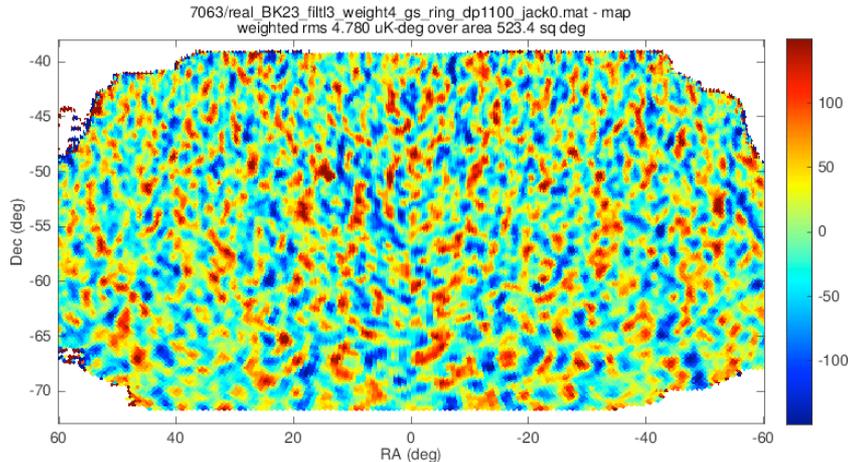

# So why so slow?

- BK18 (data up to 2018) came out in fall 2021 – approaching 4 years ago – a ~3 year “analysis delay”
- “So why no new result yet?” you may ask.
- We are trying to get to a BK24 result (data up to 2024) so if that comes out next year (2026) we will actually be catching up on real time
- Up to 2024 each result built on top of the analysis and data products of the previous release
- This was no longer sustainable and for BK24 we have reworked everything pretty much from the ground up – this took time
- But the main delay has been getting the data to pass internal consistency tests – getting rid of real but subtle systematic contamination in the ultra deep BICEP3 9-year map
- This is not optional – it would be a piece of cake to publish a result with a few sigma false upward bias on the  $r$  constraint curve
- Until the null tests pass we do not look at the real data result

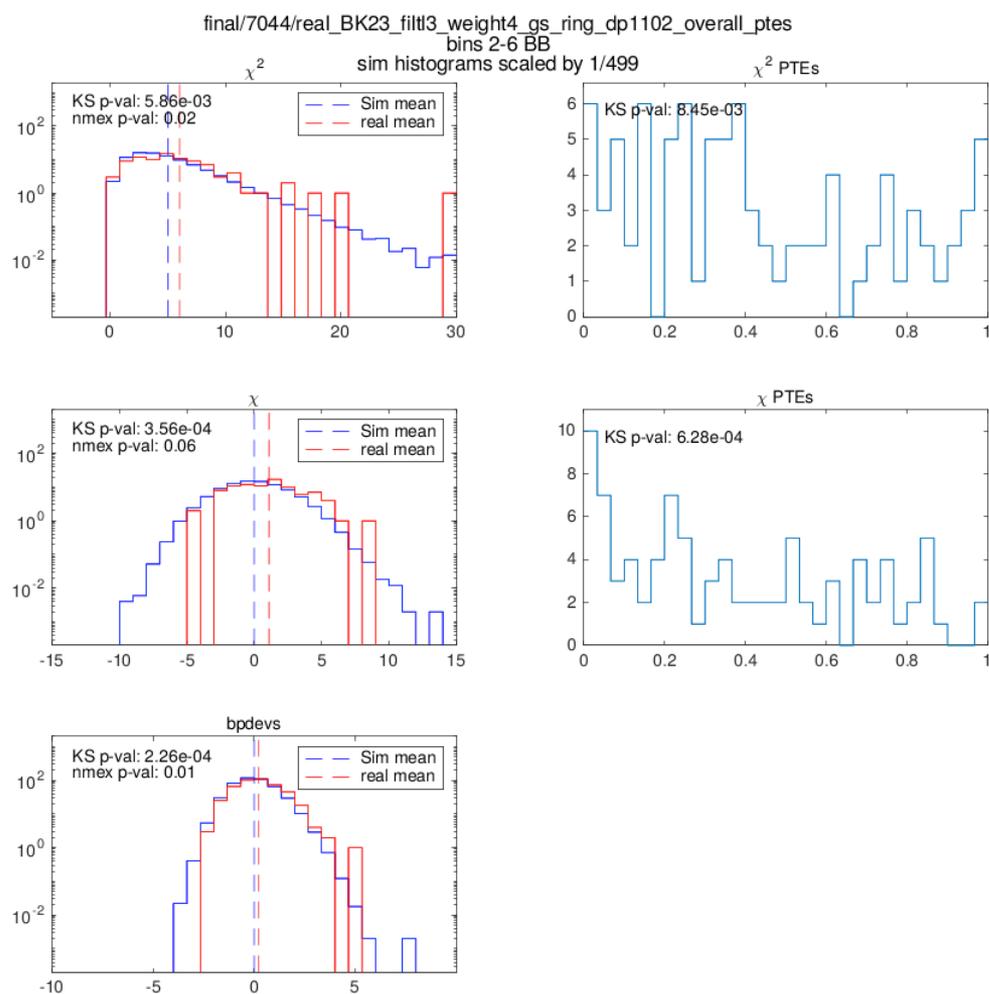

# Null tests aka jackknives

- Traditionally our main empirical test for systematic contamination
- Split the data set into two parts (usually roughly equal), form Q/U maps of the sky with each part, take the difference of these maps, and take the power spectrum of that.
- In an ideal world the true sky signal exactly cancels but systematic contamination may not do so - depending on how one has selected the split.

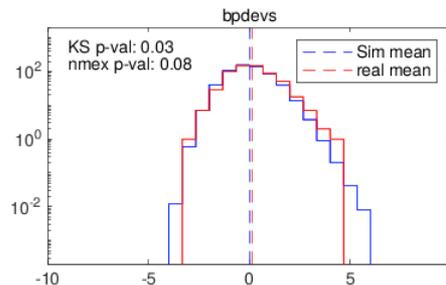

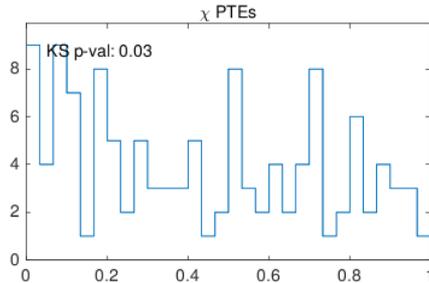

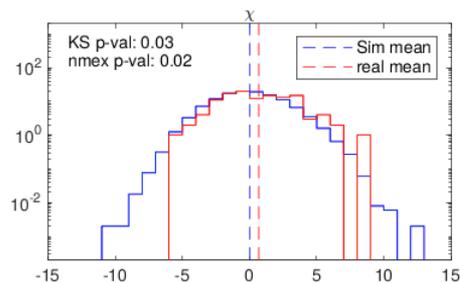

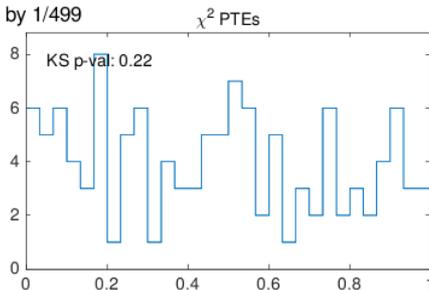

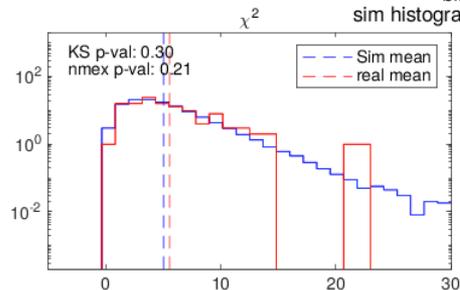

The above is BICEP3 scan direction T map and scan direction difference – percent level residuals  
It is rarely possible to actually see polarization jackknife failures in the maps

# BB jackknife summary statistics as of 2024/09

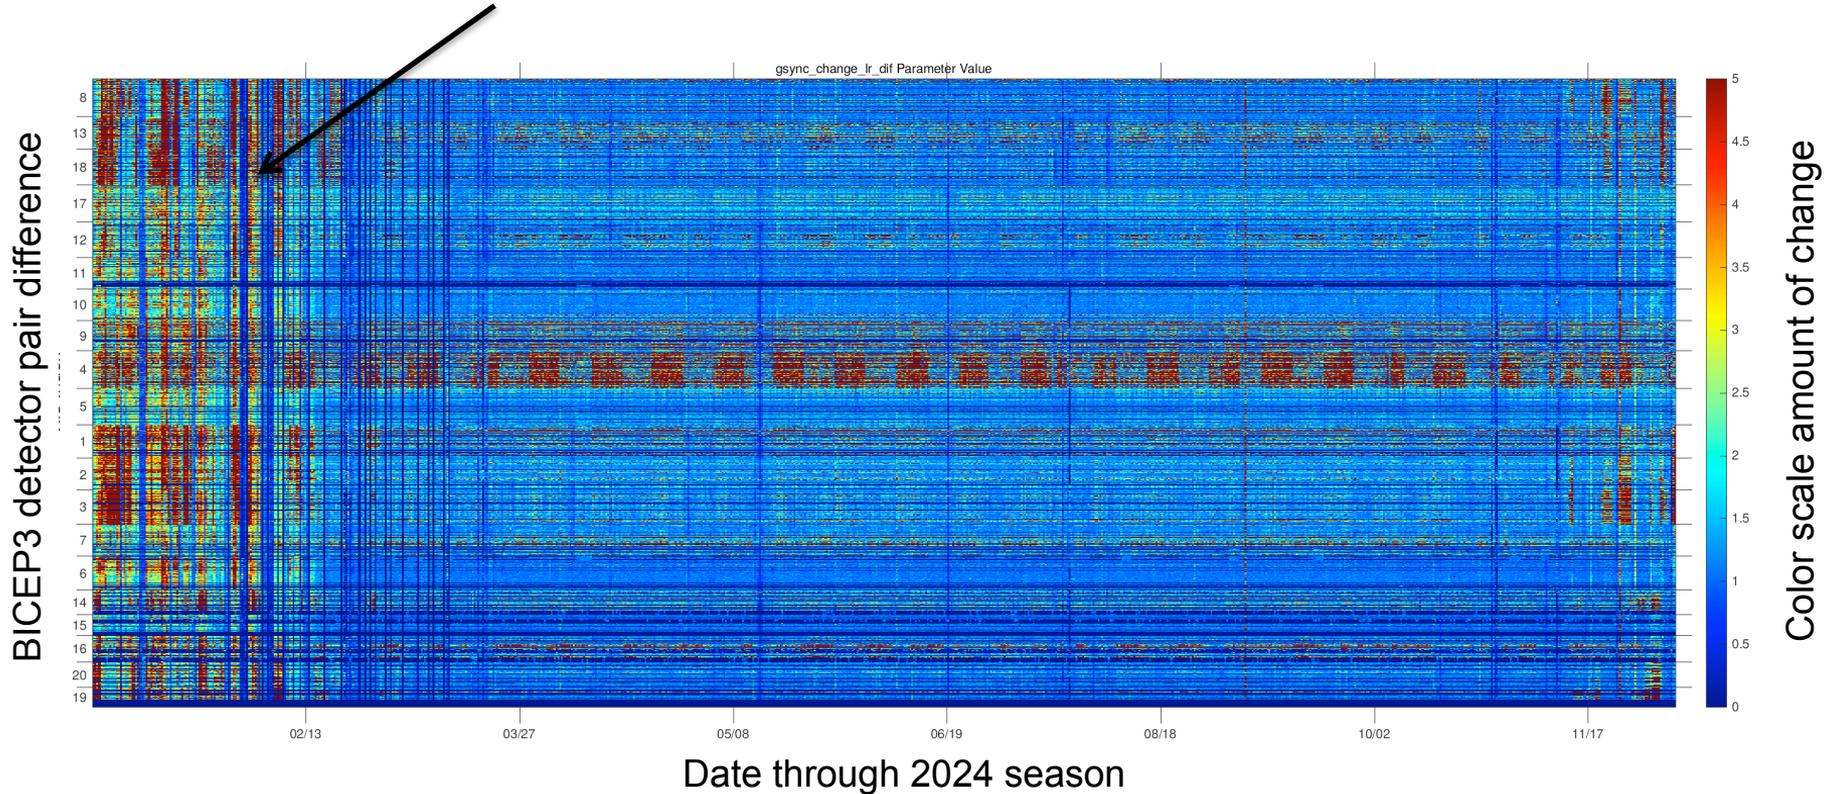

# BB jackknife summary statistics as of 2025/05

We are cleaning out subtle  
systematic contamination. Kill  
the most obvious outlier and  
other jacks get better as  
well...

Parameter designed to look for change in scan synchronous pickup left vs right scan direction

Sun contamination during Jan/Feb

# Conclusions

- BICEP/Keck leads the field in the quest to detect or set limits on inflationary gravitational waves:
  - Best published sensitivity to date
  - Best proven systematics control at degree angular scales
- Using data up to 2018 (BK18):
  - $r < 0.036$  and  $\sigma(r) = 0.009$  - ruling out multiple model classes
  - For the first time no foreground priors from other regions of sky
- Next gen BICEP Array is now running and delensing with SPT being implemented
  - With data in the can we expect  $\sigma(r) \sim 0.003$  out next year (2026)
  - With upgrades to BICEP and SPT we project  $\sigma(r) \sim 0.001$  by 2034
